Assignment Comparison and Agreed Scope

Original source: .agent/doc/project.docx. On 18 October 2026 the project owner confirmed flexible requirements and requested a Python backend with practical improvements. See docs/SCOPE.md.

Functional scope

Original requirement	Current implementation	Scope/evidence
At least three roles	Customer, Administrator, Auditor	Invited privileged roles; auditor read-only and emails withheld
MetaMask and wallet signing	EIP-1193 integration, signed wallet proof	Chromium simulated-wallet workflow passes; actual extension pending
Three interacting contracts	One Savings vault	Intentional focused scope; original count differs
Ten transaction types	Deposit, withdraw, claim, fund	Four genuine business types retained; original count differs
Backend REST / persistent database	Python/FastAPI, SQLite, compatible legacy migration	16 pytest cases; real Node-hash compatibility
Responsive dashboard and history	Chart, filters, pages, CSV and audit trail	Chromium desktop and 390px local-chain checks
Event logs	Confirmed receipt-based journal with block metadata	Manual recovery/import; no automatic full-chain indexer
Gas estimation	Expiring fee-cap preview before wallet signature	Balance/chain/account rechecks; 20% gas buffer
Gas optimisation analysis	Compiler off/on comparison	Measured gas JSON and testing report
Smart contract testing	Three local EVM tests	Accounting, reserve, top-up and partial withdrawal
Public cloud	Python Docker image and Render Blueprint	Local container checked; public URL pending

Deliverable inventory

Deliverable	Artifact	Qualification
10–15 page report	TECHNICAL_REPORT.pdf / .docx	PDF verified at 14 pages
Five diagram types	diagrams/ in PNG, SVG and Mermaid	Current Python architecture, vault, model, flow and UI
GitHub source/history	SOURCE_CODE.zip, README	Actual repository URL and genuine history not supplied
Public deployment details	DEPLOYMENT_RECORD.pdf / .md	Real URL, contract address/hash pending
Testing report	TESTING_REPORT.pdf / .md; evidence/	Local measurements; no security audit
Slides	PRESENTATION.pptx / .pdf	Twelve slides with notes
Ten-minute video/live demo	DEMO_SCRIPT.pdf / .md	Timed script only; actual performance pending

Deliverable	Artifact	Qualification
User manual	USER_MANUAL.pdf / .docx / .md	Includes auditor, fee preview and migration
Individual contribution	INDIVIDUAL_CONTRIBUTION.pdf / .docx / .md	Zeran Yao, G2509029A, sole contribution

Rubric mapping

Criterion	Original marks	Current evidence
Problem / validation	15	Sourced context and controlled scenarios; no stakeholder pilot
Architecture / design	10	Five diagrams, API and migration model
Contract security	15	Principal protection, guarded payouts and tests; no audit
Frontend / UX	10	Responsive charts, accessible table, fees and browser checks
Backend / database	10	Python, three roles, sessions, migrations and scoped exports
Blockchain functionality	10	Four coherent transaction types; relaxed count decision
Testing / impact	10	Pytest, EVM, browser and gas evidence; social impact unmeasured
Cloud / DevOps	5	Tested local image, Render configuration; public hosting pending
Innovation / feasibility	5	Transparent reserve and principal boundary; subsidy economics
Report	5	Fourteen-page report with contribution table and sources
Presentation / demo	5	Slides and timed plan; performed-demo evidence pending

No mark is predicted and original numeric differences are not concealed. Focused implementation follows the agreed flexible scope, while public identifiers and actual demonstration evidence must still be completed truthfully.
